

CASE STUDY

CAR PARK UPGRADE

FINCHLEY

In March 2022, Ross Solutions Projects (RSP) completed an extensive car park surfacing and line marking project at a block of residential flats in Finchley, North London.

As is often the case with this type of external property upgrade, the work had to be finished within a short timescale. What is more, there were the added challenges of laying tarmac and carrying out line marking when the facility was still being used by residents and their visitors.

Tarmac is an extremely reliable car park surfacing material which can withstand all kinds of weather and load bearing conditions. Given the tight schedule that the RSP team was working to, the fact that it is relatively quick and easy to install made it the ideal choice for this project compared to other commonly used surfacing materials.

RSP is a highly experienced road marking contractor and we have worked on projects to make both urban and rural roads safer throughout London and the Home Counties. This same specialist expertise has also been applied to vehicle parking areas and in fact the project for this client had come about through a recommendation from the management of another block of flats in Finchley, where we had carried out a similar car park upgrade.

When surface areas had been laid, our skilled car park line marking team provided the double yellow lines for access routes and the dividing lines and numbering for the allocated parking spaces for the property's residents. In spite of the challenge of working in a car park that was in continual use, this entire car park surfacing and line

marking project was successfully completed on time and within the agreed budget.

We are also pleased to report that the client, the building's residents and their visitors are very happy with the result!
